The global workforce is now at a tipping point (we are transitioning) out of a decades-long period of rapid growth in working-age populations and entering a new era of unprecedented population aging and slow workforce growth. Population aging is driven by three major demographic forces (first, due to improved health care and innovations) global life expectancy increased from 47 years in 1900 to 74 years in 2000². Second, total fertility rates fell drastically in the second half of the 20th century (the number of children per woman almost halved between 1900 when women had on average five children³ and 2000 when women had on average 2.1 children⁴), in all areas a surge in fertility rates in the middle of the 20th century observed largely in North America, parts of Europe, and Australia created a baby boom⁶ a population bulge now entering the older ages.
