

Outline

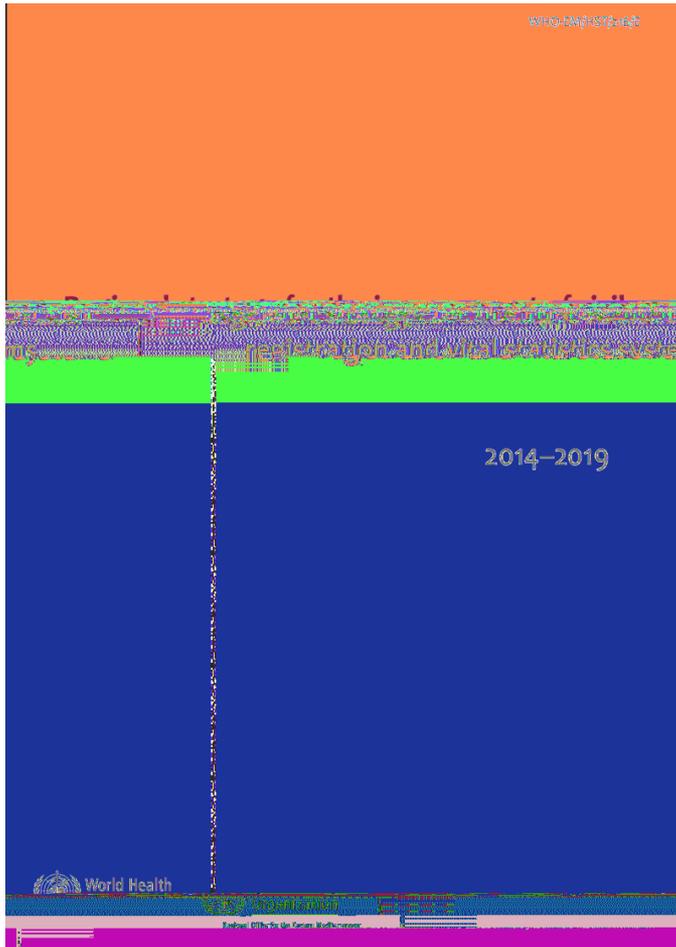

- Status of CRVS systems + mortality estimation in Western Asia
- Regional strategy for CRVS systems improvements
- Completeness assessment case studies: Kuwait & Morocco
- Methodological limitations & next steps

Mortality & Registration Paradox

2014-2019 Regional Strategy: WHO-EMRO & UN-ESCWA Focus

- Strengthen the registration infrastructure and capacities
- Improve production, use and dissemination of vital statistics
- Improve inter-sectoral coordination and alignment among stakeholders
- Strengthen and harmonize regional and global partnerships in support of country strategies

Current Approaches to CRVS Completeness (& Quality) Assessment

1.! Self-reporting in HH surveys

Reporting bias due to terminological differences

Reporting bias due to social desirability

2.! Comparison of registered deaths to E(deaths)

Misalignment between reference populations

Large sampling errors

3.! Indirect demographic estimation: Death Distribution Methods

Strong assumptions: [1] closed population, [2] completeness of recording of deaths is constant by age, [3] the completeness of recording of population is constant by age, & [4] error-free age reporting

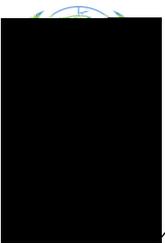

Non-negligible uncertainty intervals (Murray et al., PLoSMed-2013)

4.! Record-Linkage

Labor intensive & Technically challenging

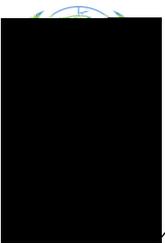

Data & Methods

- Apply different variants of death distribution methods (DDMs) to data on national populations:
 - method uses the observed population growth rates, the observed birth rate and the observed death

Data & Methods

-

Methodological Assumptions

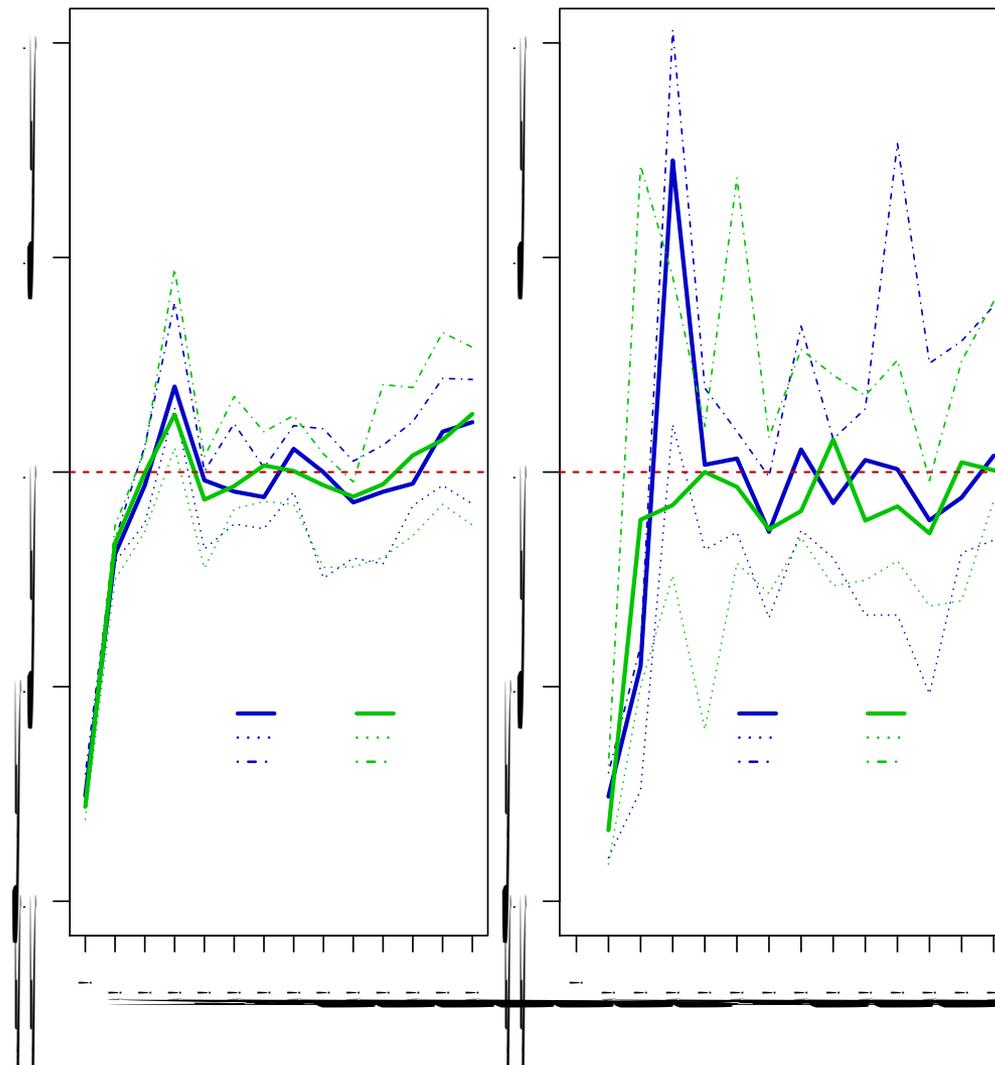

- Coverage of each individual census is the same for all ages
- Completeness of reporting of deaths is the same for all ages from a minimum age

Death Register: Age Ratio

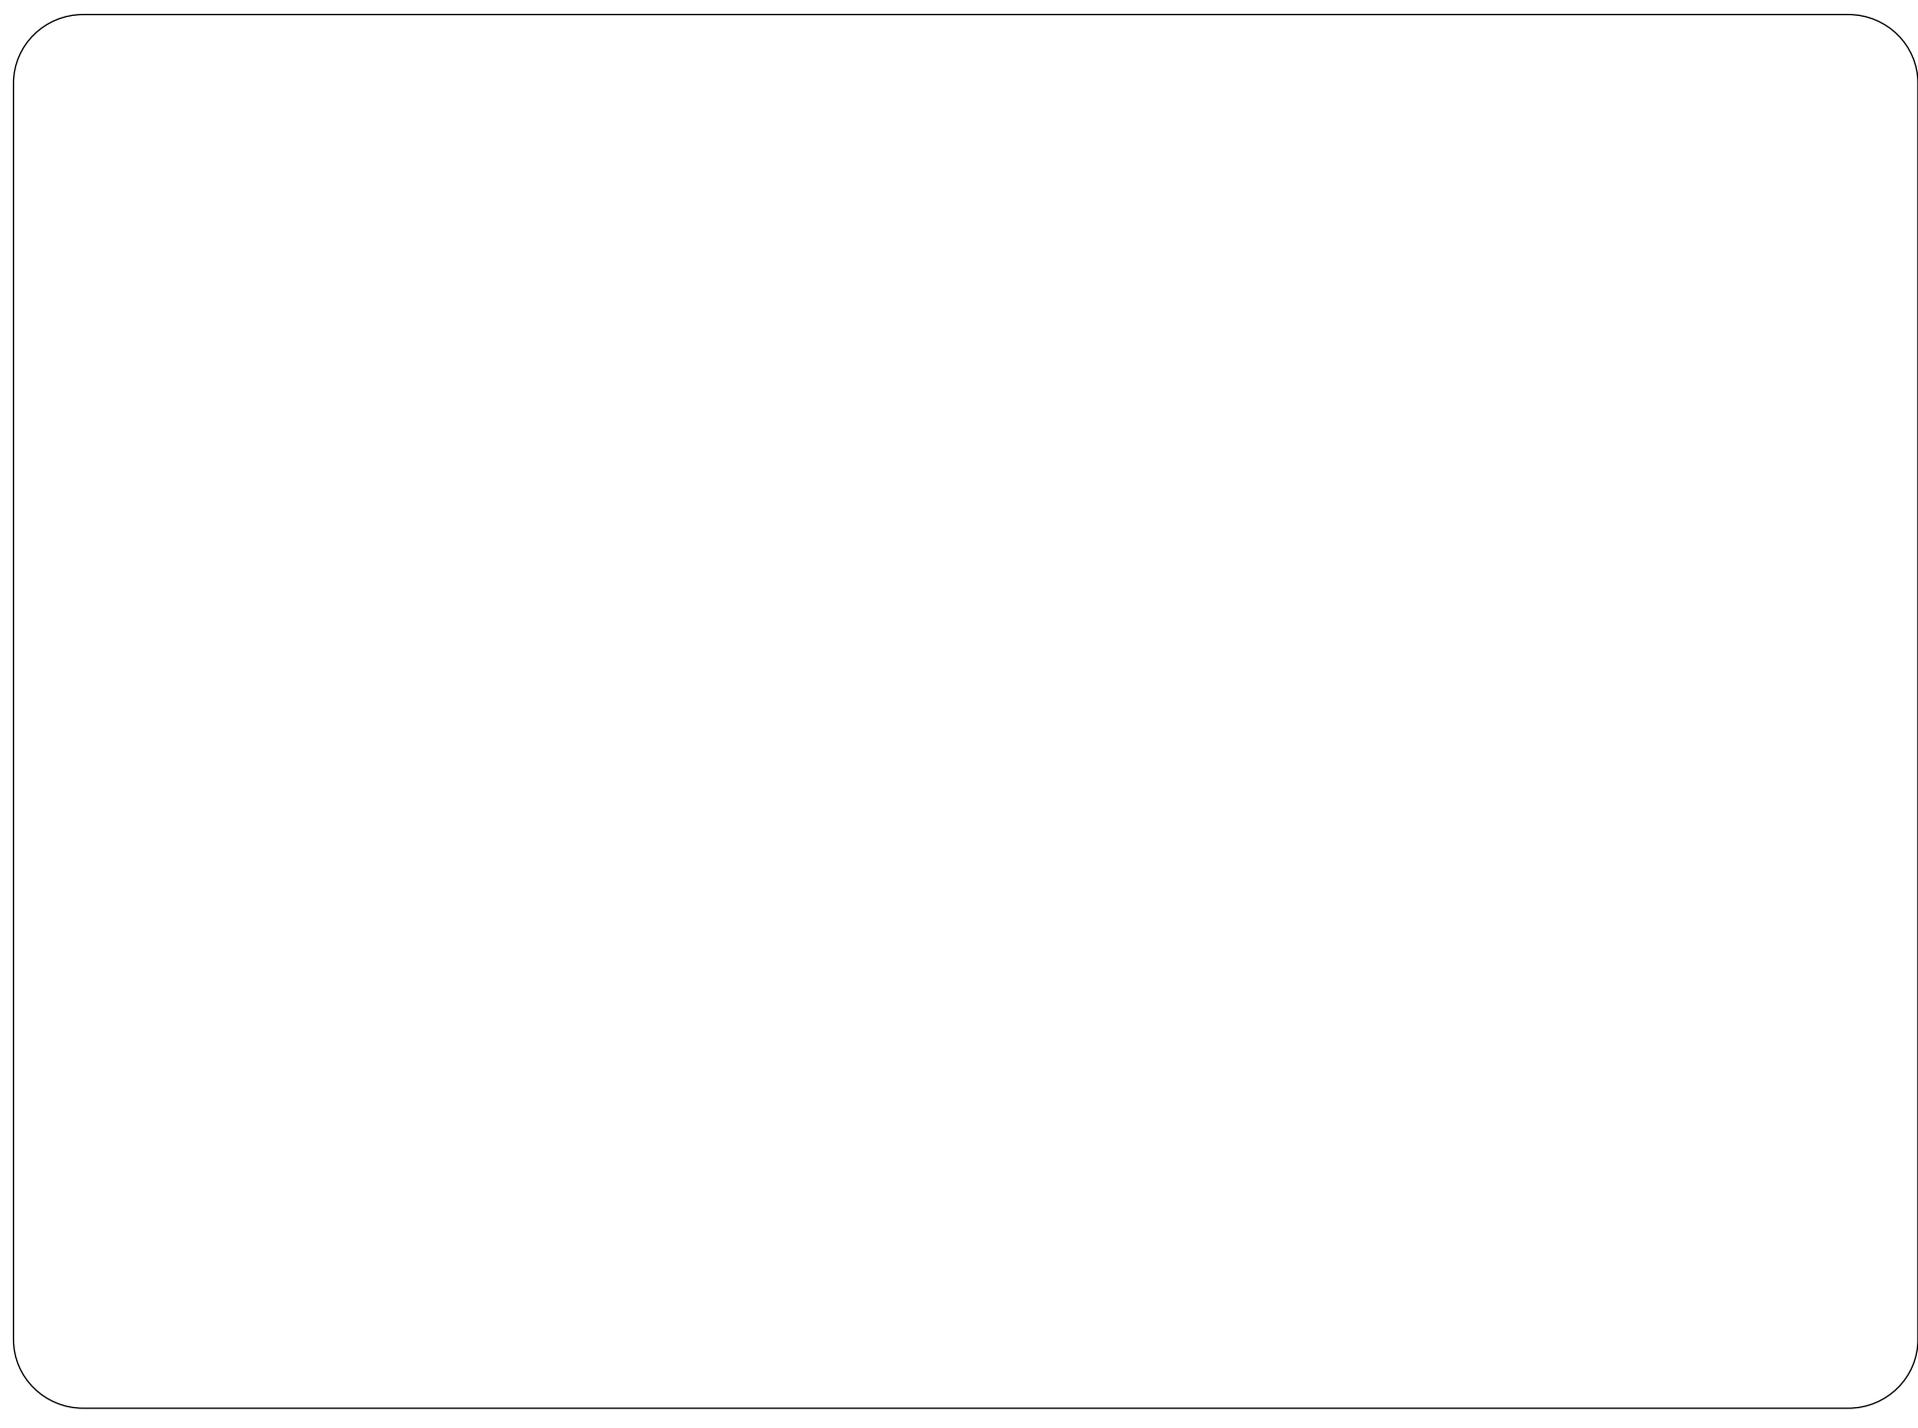

Morocco

Kuwait

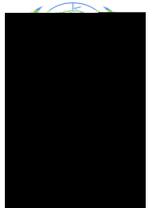

$$AR D_x = \frac{2 \times {}_5D_x}{{}_5L_{x-n} + {}_5L_{x+n}}$$

Death Registration Completeness Estimates: Comparison with UNPD Official Estimates

Member	Male	Female	WPP, 2012
--------	------	--------	-----------

Comparison Table of Adult Mortality Estimates ($_{45}q_{15}$) by Sex derived using the Adjusted SEG Method and those published in WPP, 2012

Tentative Conclusions

Kuwait

Limited insight from application of DDMs

Published DR data only available for nationals (~1/3 of resident population)

DDMs sensitive to reporting errors/bias given small pop size

Morocco

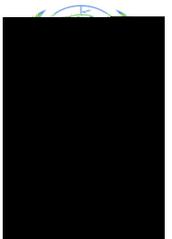

Notable sex differential in DR completeness

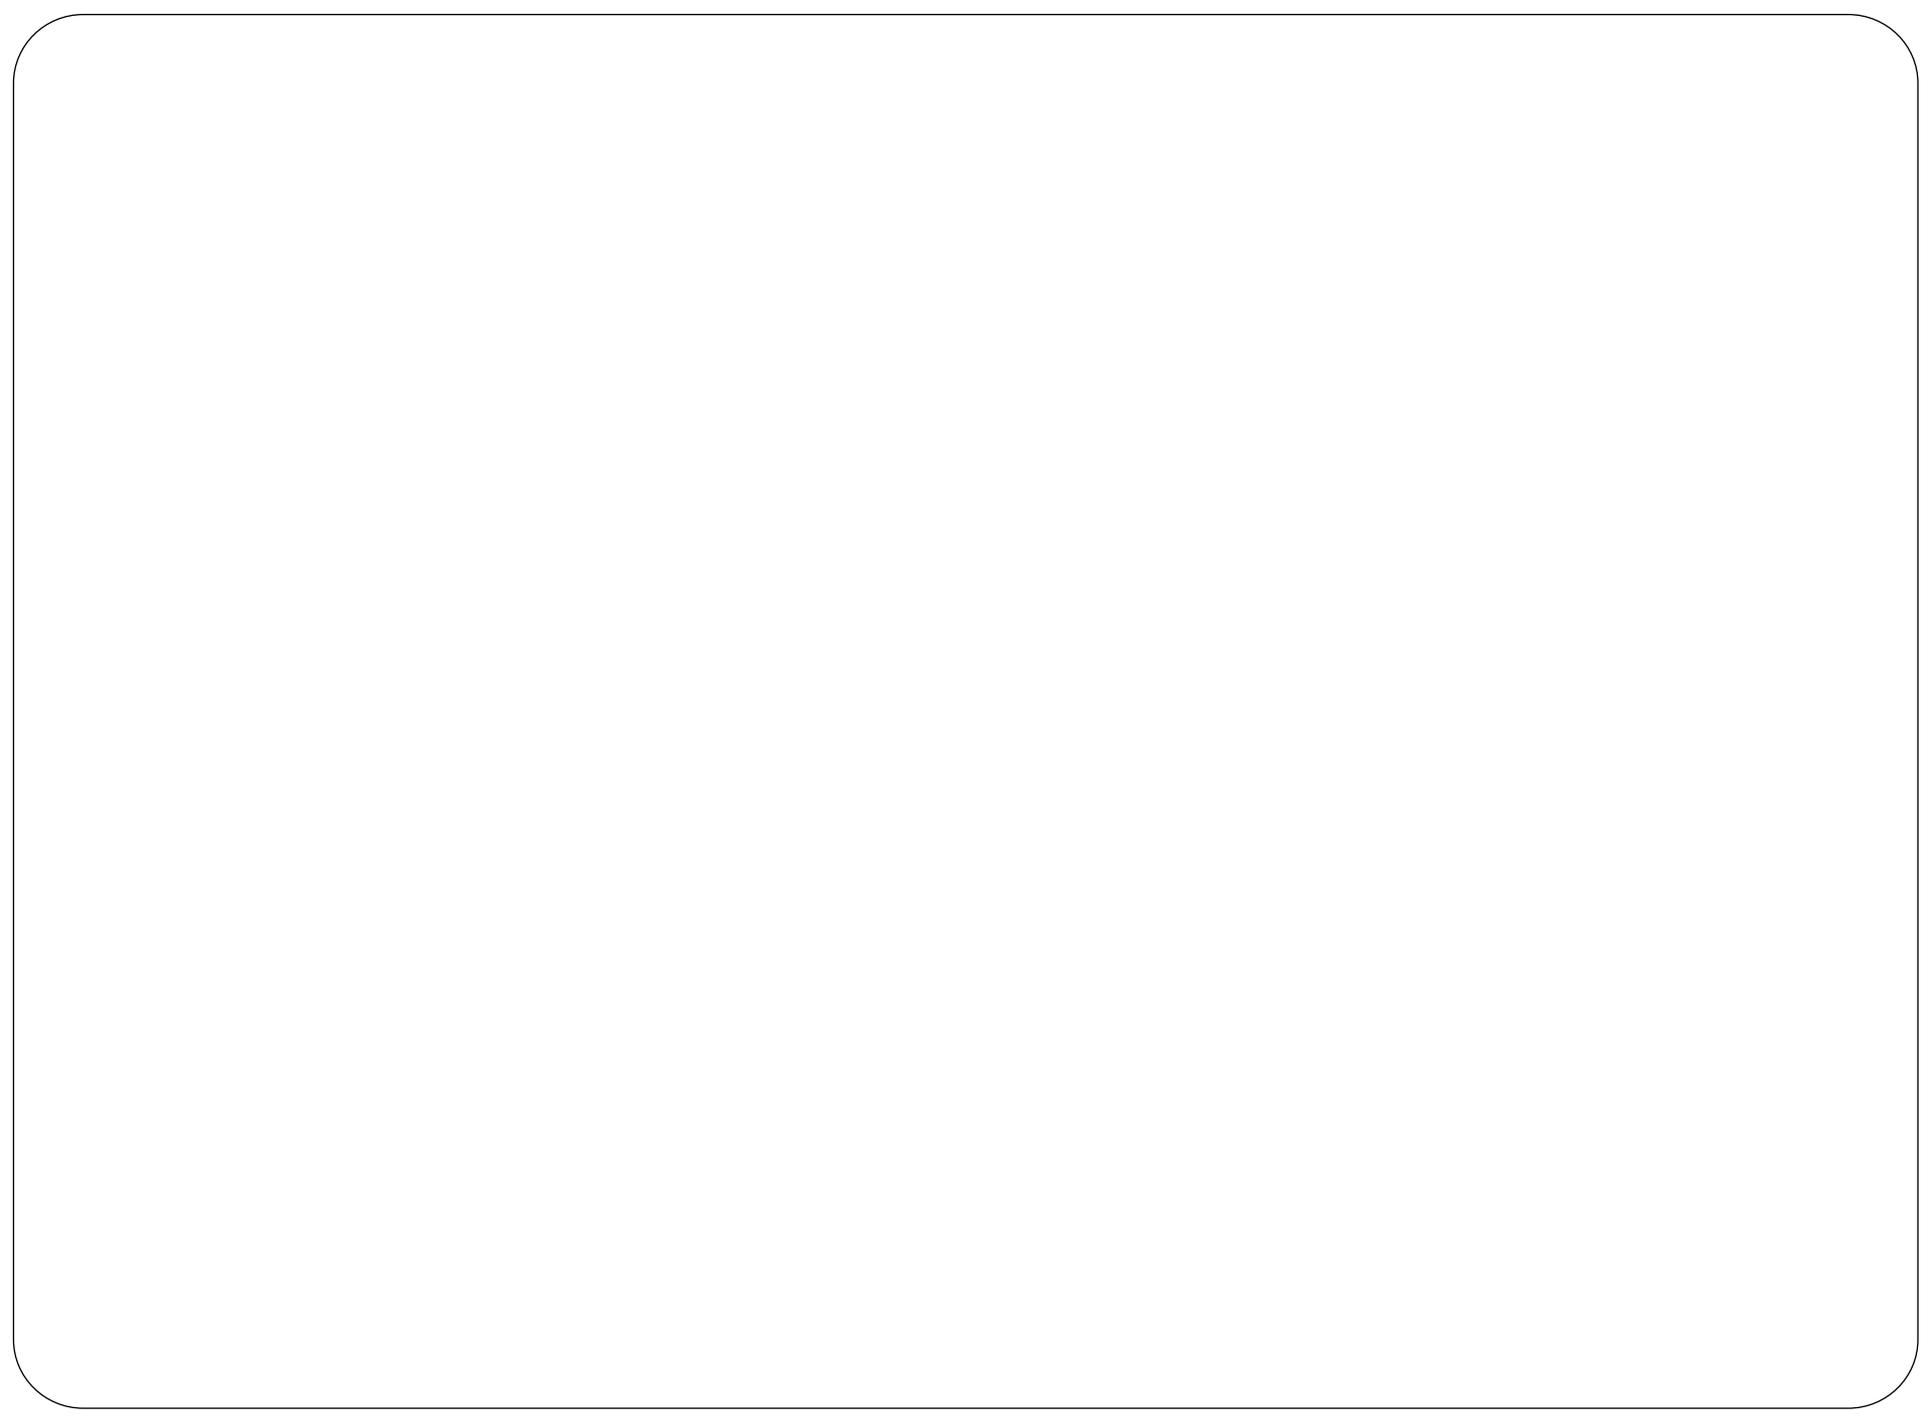

Likely a rural phenomenon, but need internal migration data

Methodological

Subjective-choice of age-trim

Effects of assumption violations

Thank you!
