

## Statement by

Mr. President, I would like to thank the Secretary-General for his statement. I would also like to thank the members of the Security Council for their support in the development of the resolution.

I would like to emphasize that the resolution is based on the principles of international law and the United Nations Charter. It is a clear message that the international community is committed to upholding the principles of democracy, human rights, and the rule of law.

The resolution also highlights the importance of addressing the root causes of conflict and poverty. It calls for a comprehensive approach that includes economic development, political reform, and social justice.

I would like to reiterate that the resolution is a call for peace and stability. It is a call for all parties involved in the conflict to work together towards a peaceful resolution. It is a call for the international community to support the efforts of the United Nations and its member states in promoting peace and stability.

Finally, I would like to thank the Secretary-General again for his leadership and the members of the Security Council for their support. I believe that this resolution will help to bring about a more peaceful and stable world.

and racism. If we handle it right most of us can bring a good will  
contagion to the benefit of us all.

This is why we have gathered here in this place, to witness the birth of our nation, to proclaim our independence, and to lay the foundations of our future.

Mr. Powell does not remember ever having been present at the meeting of the Board of Directors of the Bank of America on January 12, 1937.

However, it's important to understand that this is not always correct.

For example, consider the following code snippet:

```
def calculate_mean(numbers):
```

```
    total = sum(numbers)
```

```
    count = len(numbers)
```

```
    mean = total / count
```

```
    return mean
```

```
numbers = [1, 2, 3, 4, 5]
```

```
mean = calculate_mean(numbers)
```

```
print(f"The mean is {mean}.")
```

```
The output of this code is:
```

```
The mean is 3.0.
```

```
This result is correct because the average of the numbers 1, 2, 3, 4, and 5 is indeed 3.0.
```

```
Now, let's consider what would happen if we added a new value to the list:
```

```
numbers = [1, 2, 3, 4, 5, 6]
```

```
mean = calculate_mean(numbers)
```

```
print(f"The mean is {mean}.")
```

```
The output of this code is:
```

```
The mean is 3.5.
```

```
This result is incorrect because the average of the numbers 1, 2, 3, 4, 5, and 6 is actually 3.5, not 3.0.
```

```
So, while the original code is correct, it's important to understand that it may not always be correct in all cases.
```

For example, consider the following code snippet:

```
def calculate_mean(numbers):
```

```
    total = sum(numbers)
```

```
    count = len(numbers)
```

```
    mean = total / count
```

```
    return mean
```

```
numbers = [1, 2, 3, 4, 5]
```

```
mean = calculate_mean(numbers)
```

```
print(f"The mean is {mean}.")
```

```
The output of this code is:
```

```
The mean is 3.0.
```

```
This result is correct because the average of the numbers 1, 2, 3, 4, and 5 is indeed 3.0.
```

```
Now, let's consider what would happen if we added a new value to the list:
```

```
numbers = [1, 2, 3, 4, 5, 6]
```

```
mean = calculate_mean(numbers)
```

```
print(f"The mean is {mean}.")
```

```
The output of this code is:
```

```
The mean is 3.5.
```

```
This result is incorrect because the average of the numbers 1, 2, 3, 4, 5, and 6 is actually 3.5, not 3.0.
```

```
So, while the original code is correct, it's important to understand that it may not always be correct in all cases.
```

Figure 1. The effect of the number of hidden neurons on the performance of the proposed model.

Figure 1. A 2D visualization of the learned features from the first layer of the neural network. The features are visualized as a heatmap where each pixel corresponds to a feature vector. The color scale indicates the magnitude of the feature vector.

Figure 1. A comparison of the spectral characteristics of the two samples. The left panel shows the spectrum of the sample with the highest concentration of  $\text{Fe}^{2+}$  ( $10^{-3}$  M), and the right panel shows the spectrum of the sample with the lowest concentration of  $\text{Fe}^{2+}$  ( $10^{-4}$  M). The x-axis represents the wavenumber in cm $^{-1}$ , ranging from 4000 to 500. The y-axis represents the transmittance.

Figure 1. Schematic diagram of the experimental setup. The light source (laser) emits light at  $\lambda = 532$  nm. The beam splitter (BS) splits the beam into two paths. The first path contains a lens (L<sub>1</sub>) and a polarizer (P<sub>1</sub>). The second path contains a lens (L<sub>2</sub>) and a polarizer (P<sub>2</sub>). The two paths converge at a point where they are imaged by a camera (C). The camera is connected to a computer (PC) for data processing.
